

Ticket-IT Intelligent Campaign Creation

User Specification

1. Purpose

Create a guided campaign workflow that allows Marketing and Promotions users to plan, generate and schedule content across Digital Signage and ESL networks.

The workflow must combine store information, available devices, retail data, AI product recommendations and approved templates. Users must not need prompt-writing expertise. Ticket-IT will construct the AI prompt from structured selections and short sentence inputs.

2. Primary user story

As a Marketing user, I want to define the campaign objective, audience, stores, media, devices and promotional rules so Ticket-IT can recommend suitable products, generate approved content and schedule it across the selected retail network.

3. Campaign workflow

Screen 1 — Create Campaign

The user enters:

- Campaign name
- Campaign objective
- Campaign owner
- Optional description or reference

The campaign is saved initially as a Draft.

Screen 2 — Set Campaign Schedule

The user selects:

- Start date and time
- Finish date and time
- Active days

- Store opening hours
- Content-change frequency

ESL campaigns must allow no more than four content changes per day within store opening hours.

Screen 3 — Select Campaign Stores

The user filters and selects stores by:

- Geographic region
- Store format
- Store group
- Store tags
- Individual store

The screen must dynamically display:

 126 of 200 stores selected

Controls must include Select All, Clear All and View Selected Stores.

Screen 4 — Select Campaign Media

The user selects:

- Digital Signage
- ESL
- Digital Signage and ESL

Selecting both creates separate content requirements within one campaign.

Screen 5 — Select Campaign Devices

Available devices are filtered by the selected stores and media.

Filters include:

- Device tags
- In-store location
- Format and orientation
- Screen resolution
- ESL size
- ESL colour capability
- Device status

The interface must dynamically display the number of selected devices by media type and store.

Screen 6 — Build Campaign Brief

The user completes a guided brief instead of writing an AI prompt from scratch.

Sections include:

1. **Campaign objective** — sales, margin, stock reduction, product launch, loyalty or supplier campaign.
2. **Data to analyse** — sales, margin, stock, promotions, basket relationships, loyalty and regional demand.
3. **Products to consider** — AI recommendations, category, supplier, brand or user-selected products.
4. **External factors** — weather, public holidays, seasonality, local events and time of day.
5. **Content required** — product promotion, category promotion, brand advert, loyalty message, store-wide offer or opening hours.
6. **Additional rules** — short sentence inputs for stock thresholds, exclusions or campaign priorities.

Ticket-IT combines these answers with the campaign schedule, stores, media and selected devices to generate a complete AI prompt.

The user may select Edit Answers, Regenerate Prompt or Continue.

Screen 7 — Select Products and Content

Display AI-recommended products with:

- SKU and description
- Regular and promotional price
- Saving
- Margin
- Stock availability
- Eligible stores
- AI recommendation reason
- Proposed content type

The user can approve, remove, replace or manually add products.

Screen 8 — Select Templates

Show only templates compatible with the selected media, device formats and sizes.

Digital Signage may use static or animated templates. ESL content must always be static.

Screen 9 — Generate and Preview Content

Generate content using the approved templates and selected data. The user can preview each output by media type, format and size.

Screen 10 — Review Campaign

Display a complete summary of the campaign, including stores, devices, products, content, schedule and validation warnings.

Screen 11 — Create and Schedule Campaign

The user confirms the campaign. Ticket-IT validates device availability, template compatibility, scheduling conflicts and ESL update limits before setting the campaign status to Scheduled.
